The figure is a geological map of a coastal area, likely the northern coast of Chile, showing a cross-section of the landscape. The map includes several key features:

- Lithology:** The map uses different colors to represent various rock types. A legend in the top left corner identifies these colors: light blue for 'Coral', light green for 'Sedimentario', dark green for 'Volcánico', red for 'Isla de Pascua', orange for 'Isla de Pascua', purple for 'Isla de Pascua', and black for 'Isla de Pascua'. A large area in the center-right is labeled 'Zona de pr' (likely 'Zona de procesamiento').
- Structures:** Black lines representing geological structures are visible, particularly a prominent diagonal line running from the bottom left towards the top right.
- Stratigraphy:** A large, thick, light-colored layer is labeled 'M2b' in white text. This layer is bounded by horizontal lines and appears to represent a major stratigraphic unit. Other layers are visible above and below this unit.
- Coastal Features:** The map shows a coastline on the left side, indicated by a dashed line and arrows pointing outwards.

Detailed description: This is a horizontal strip of a geological map of the Gulf of Mexico region. The map shows various oil and gas fields, indicated by small circles with numbers. A large number of thick black lines represent pipelines, many of which are labeled with names like 'Piney Point', 'Tulane', 'Gulf Intracoastal Waterway', 'Mississippi River', and 'Cushing'. The map also features numerous dashed lines representing geological boundaries such as faults and unconformities. A legend in the bottom right corner identifies symbols for oil/gas fields, pipelines, and geological features. The overall color scheme includes shades of green, brown, and grey.
